UNIVERSAL MISSIONS

```
$ git <command> <options>
_
```

E.g.

▶ git add myfile.txt

```
$ git <command> <options>
```

E.g.

- ▶ git add myfile.txt
- ▶ git status

```
$ git <command> <options>
E.g.
```

- ▶ git add myfile.txt
- ▶ git status
- ▶ git commit -m "add myfile"

```
$ git <command> <options>
E.g.

    git add myfile.txt
    git status
    git commit -m "add myfile"
    git log
```

▶ git commit --help

- ▶ git commit --help
- ▶ git checkout 5d34bf1 myfile.txt

- ▶ git commit --help
- ▶ git checkout 5d34bf1 myfile.txt
- ▶ git checkout 5d34bf1

- ▶ git commit --help
- ▶ git checkout 5d34bf1 myfile.txt
- ▶ git checkout 5d34bf1
- ▶ git checkout HEAD myfile.txt

- ▶ git commit --help
- ▶ git checkout 5d34bf1 myfile.txt
- ▶ git checkout 5d34bf1
- ▶ git checkout HEAD myfile.txt
- ▶ git revert 5d34bf1

Episode 5: Recovering Older Versions of a File

Which commands below will let you recover the last committed version of the Python script called data_cruncher.py?

- 1. \$ git checkout HEAD
- 2. \$ git checkout HEAD data_cruncher.py
- 3. \$ git checkout HEAD~1 data_cruncher.py
- 4. \$ git checkout <unique ID of last commit> data_cruncher.py

Episode 5: Reverting a Commit

Below are the right steps and explanations for Jennifer to use git revert¹, what is the missing command?

- 1. _____ # Look at the git history of the project to find the commit ID
- 2. Copy the ID (the first few characters of the ID, e.g. 0b1d055).
- 3. git revert [commit ID]
- 4. Type in the new commit message.
- 5. Save and close

¹The command git revert is different from git checkout [commit ID] because git checkout returns the files not yet committed within the local repository to a previous state, whereas git revert reverses changes committed to the local and project repositories.

Episode 5: Understanding Workflow and History

What is the output of the last command in:

```
$ cd planets
```

- \$ echo "Venus is beautiful and full of love" > venus.txt
- \$ git add venus.txt
- \$ echo "Venus is too hot to be suitable as a base" >> venus.txt
- \$ git commit -m "Comment on Venus as an unsuitable base"
- \$ git checkout HEAD venus.txt
- \$ cat venus.txt

Episode 5: Understanding Workflow and History

What is the output of the last command in:

```
$ cd planets
$ echo "Venus is beautiful and full of love" > venus.txt
$ git add venus.txt
$ echo "Venus is too hot to be suitable as a base" >> venus.txt
$ git commit -m "Comment on Venus as an unsuitable base"
$ git checkout HEAD venus.txt
$ cat venus.txt
```

Answer: Venus is beautiful and full of love

Episode 6: Ignoring Nested Files

Given a directory structure that looks like:

results/data results/plots

How would you ignore only results/plots and not results/data?

Episode 6: Ignoring Nested Files

Given a directory structure that looks like:

results/data results/plots

How would you ignore only results/plots and not results/data?

results/plots/

Episode 6: Including specific files

How would you ignore all .dat files in your root directory except for final.dat?

Hint: Find out what ! (the exclamation point operator) does

Episode 6: Including specific files

How would you ignore all .dat files in your root directory except for final.dat?

Hint: Find out what ! (the exclamation point operator) does

```
*.dat # ignore all data files
```

!final.dat # except final.data

Episode 6: Ignoring Nested Files: Variation

Given a directory structure that looks similar to the earlier Nested Files exercise, but with a slightly different directory structure:

results/data results/images results/plots results/analysis

How would you ignore all of the contents in the results folder, but not results/data?

Hint: think a bit about how you created an exception with the ! operator before.

Episode 6: Ignoring Nested Files: Variation

Given a directory structure that looks similar to the earlier Nested Files exercise, but with a slightly different directory structure:

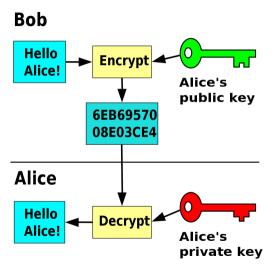

```
results/data
results/images
results/plots
results/analysis
```

How would you ignore all of the contents in the results folder, but not results/data?

Hint: think a bit about how you created an exception with the ! operator before.

```
results/* # ignore everything in results folder !results/data/ # do not ignore results/data/ contents
```

Public key encryption

Put the following actions in order, and give the commands needed to achieve the action:

- Make changes by appending the number 100 to a text file numbers.txt
- Update remote repository to match the local repository
- Celebrate your success with some fancy beverage(s)
- Update local repository to match the remote repository
- Stage changes to be committed
- Commit changes to the local repository

order	action	command	
1			
2			
3			
4			
5			
6	Celebrate!	AFK	

order	action	command
1	Update local	git pull origin main
2		
3		
4		
5		
6	Celebrate!	AFK

order	action	command
1	Update local	git pull origin main
2	Make changes	echo 100 >>numbers.txt
3		
4		
5		
6	Celebrate!	AFK

order	action	command
1	Update local	git pull origin main
2	Make changes	echo 100 >>numbers.txt
3	Stage changes	git add numbers.txt
4		
5		
6	Celebrate!	AFK

order	action	command
1	Update local	git pull origin main
2	Make changes	echo 100 >>numbers.txt
3	Stage changes	git add numbers.txt
4	Commit changes	git commit -m "Add 100 to numbers.txt"
5		
6	Celebrate!	AFK

1 Update local git pull origin main
git pull origin main
2 Make changes echo 100 >> numbers.txt
3 Stage changes git add numbers.txt
4 Commit changes git commit -m "Add 100 to numbers.txt"
5 Update remote git push origin main
6 Celebrate! AFK

Git in Practice

- ▶ I am a big fan!
- ► Great way to be transparent
- ► GitHub can be linked to OSF and Zenodo
- ► No need to use command line

Reflection

- ▶ What would you like to do with git?
- ► What do like about git?
- ▶ What don't you like about git?
